The stations follow a broadly consistent structure: introduction, scenario, mark sheet and instructions to actor, designed to allow candidates to work through each exam station under exam conditions either individually or in a group.

This book explores the current impasse that global regulators face in the digital sphere. Computer technology has advanced human civilization tenfold, but the freedom to interact with others in cyberspace has made individuals, discrete communities, organizations and governments more vulnerable to abuse. In consequence, political decision makers are seriously considering granting limited legal immunity to victims who decide to hack back. Many victims, frustrated by the slow pace of law enforcement in cyberspace, have chosen to take the law into their own hands, retaliating against those who have stolen valuable data and damaged network operations. Political deliberations about limited immunity for hackbacks usually ignore global justice and moral justifications for active defense policies. Typically, cyber security policies balance deterrence against two different understandings of morality and the good life: fairness or welfare. This book proposes a third moral rationale for cyber security policies: capability theory. Developed principally by Amartya Sen and Martha Nussbaum, properly formulated, a capability based defense of retaliatory hackbacks can minimize attribution and cyber escalation risks, deter bad behavior by casual computer users, disingenuous security experts, big tech companies, criminals and rogue governments, and satisfy calls for more retributive and distributive justice in the open world. This book will appeal to legal theorists, political philosophers, social activists, investors, international relations scholars and businesspeople in the tech community.

this book presents an innovative concept for the realization of sensors based on a planar metamaterial microwave array and shows their application in biomedical analysis and treatment the sensors are able to transduce the dielectric properties of materials in their direct vicinity into an electric signal the specific array organization permits a simultaneous analysis of several materials using a single readout signal or a relative characterization of one material where information about its spatial distribution can be extracted two applications of the designed sensors are described here the first is a cytological screening using micro fluidic technology which shows that the sensors may be integrated into lab on chip technologies the second application regards the use of the sensor in both the analysis and treatment of organic tissues the developed sensor is able not only to screen the tissues for abnormalities but also by changing the applied signals to perform thermal ablation and treat the abnormalities in a highly focused way thus the research described in this book represents a considerable advancement in the field of biomedical microwave sensing
